

ZORVEC® Enicade®

FUNGICIDE

Zorvec® Enicade® is a new and highly effective fungicide for more consistent, long-lasting control of Downy mildew. Zorvec Enicade is protected from wash-off just 20 mins after the spray has dried, with acropetal (outwards) systemic movement it circulates in the plant to protect new growth.

Zorvec Enicade: This changes everything.

Zorvec Enicade Fungicide gives you a powerful new weapon in the fight against downy mildew.

It will change the way you look at disease control, helping you realise:

Zorvec Enicade provides unmatched consistency and control every season, even under the most challenging environmental conditions.

To manage resistance, always follow these guidelines:

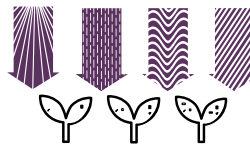

- Apply fully labeled rates at recommended spray interval for effective disease control.
- Use in the first half of the growing season to protect new growth.
- Use in a program with different mode of action fungicides.
- Apply preventively before first signs of disease.
- Where possible, apply in a block of 2 applications.
- Where possible, follow with a curative fungicide.

NO CROSS RESISTANCE
with any current fungicides

MULTIPLE EFFECTS
on the disease life cycle

EXCELLENT ENVIRONMENTAL PROFILE

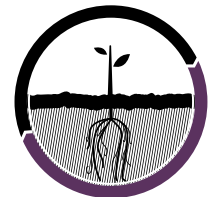

DELIVERS LONG LASTING
consistent disease control

even under high disease pressure
Depending on environmental conditions.

Consistent control
SEASON AFTER SEASON

Zorvec Enicade fungicide delivers an unmatched combination of consistency and control of Downy mildew. It affects multiple stages of the disease life cycle, and its acropetal movement in the plant means that the product helps protect new growth. Rain will not wash it off, even as little as 20 minutes after the spray residue has dried on the leaves.

For these reasons, Zorvec Enicade enables vegetable farmers to grow better crops, for a better business. Farmers can reduce waste from Downy mildew disease and improve their productivity.

Here's what growers, researchers, consultants and agronomists say:

Chris Themsen, Peracto, Bundaberg, QLD

"We did early research development work with DuPont on this product when it was still a coded formulation. Our comment to DuPont was that it was the best Downy mildew product that we'd seen."

Untreated control

Zorvec Enicade at label rate (350 mL/ha)

Phil Frost, Peracto Devonport, TAS

"I've worked with Zorvec Enicade in trials around Australia in a range of different crops and it consistently provides good disease control and you end up with good quality crop and higher yields from it."

Adam Schreurs, Clyde, VIC

"Downy mildew is one of our biggest issues in rocket crops as well as spinach. Mildew tends to stunt the growth and the chemicals we currently use don't seem to keep mildew out. I've been using Zorvec Enicade here in trials for 18 months. Every trial I've seen it in has been terrific."

Eddy Dunn, Hortus Technical Services, Bundaberg, QLD

"It is quite fortunate that Zorvec Enicade came out when it did. We used it on the rockmelons and had a brilliant result. The Zorvec Enicade has worked really well."

Gavin Hibberd, Zerella Fresh, Virginia, SA

"One of the trial plots was very similar to our current program. Right next to it was the Zorvec Enicade. You could see it was chalk and cheese. Zorvec Enicade looks like she's got the job."

Vince Lamattina, A & F Lamattina, Clyde, VIC

"I sprayed Zorvec Enicade when there was pressure around and that did not get it at all, for two weeks after application. I was really happy. It is a good product. We used it on Rocket in the early stages and that's also grown quite well."

Clinton Marcon, Marcon Family Farms, Bundaberg, QLD

"Downy really knocks us around a bit. This year it hasn't been a problem. We've used Zorvec Enicade. This crop (Zucchini's) here is now at 1600 and we've probably got another couple of weeks left of picking. We could see up around 1700, 1800 boxes an acre which is something that I've never achieved."
